

ORACLE SQL TUTORIAL

Agenda

1 **Introduction**

2 **Creation of Table**

3 **Oracle setup and installation**

4 **Relational Model**

5 **Miscellaneous topics**

6 **Operators as keywords**

7 **Functions**

8 **Clauses**

9 **Nested Query**

10 **SQL Commands**

11 **Database Objects and SP**

Introduction

Introduction

DATA

DATABASE

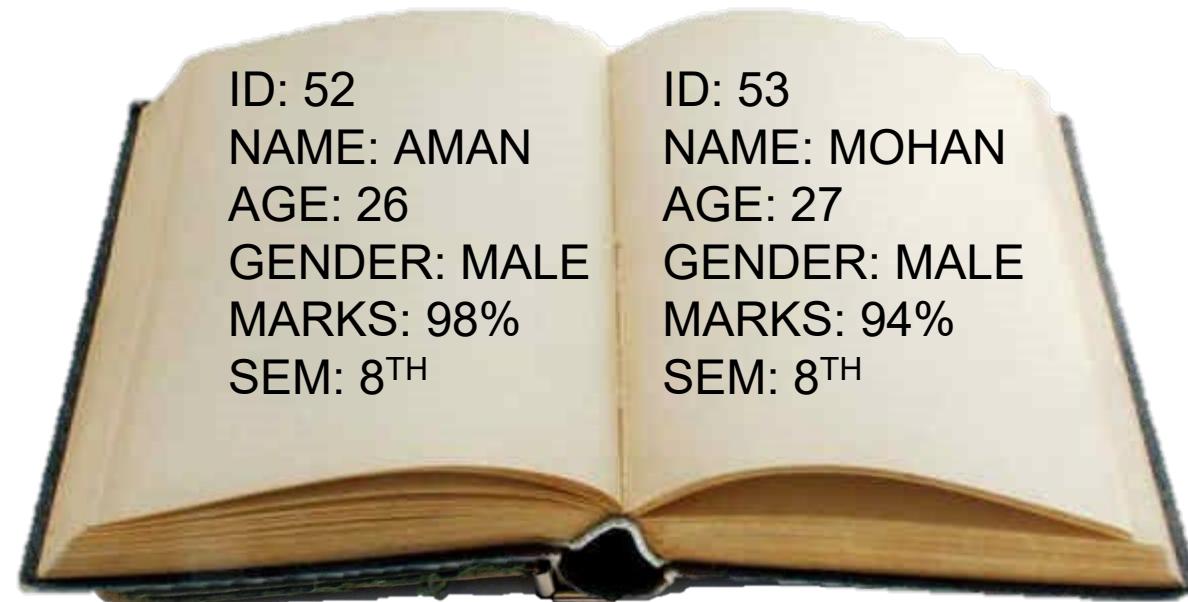

Introduction

Managing refers to storing permanently and retrieving efficiently

1. How to store data(small volumes of facts) permanently and how to retrieve (get the stored facts) efficiently?
2. How to store database(large volumes of facts) permanently and how to retrieve(get the stored large volumes of facts) efficiently ?

Introduction

In the below LEDGER, one page has DATA(small volume of FACT) and all pages and many books put together forms DATABASE(large volume of FACTS)

Introduction

PROBLEMS associated in managing DATA or DATABASE in LEDGERS:-

1. Security challenges
2. Back up issues
3. Space issues
4. Human Resource issue
5. Costly
6. Inefficiency in retrieving facts

etc.

COMPUTERS came into existence in 1940s but it was very costly, so people did not think of using computers. But in late 1950s, Computer prices came low as compared to 1940s and people thought of using computers to manage facts and figures, But there were no means to do it.

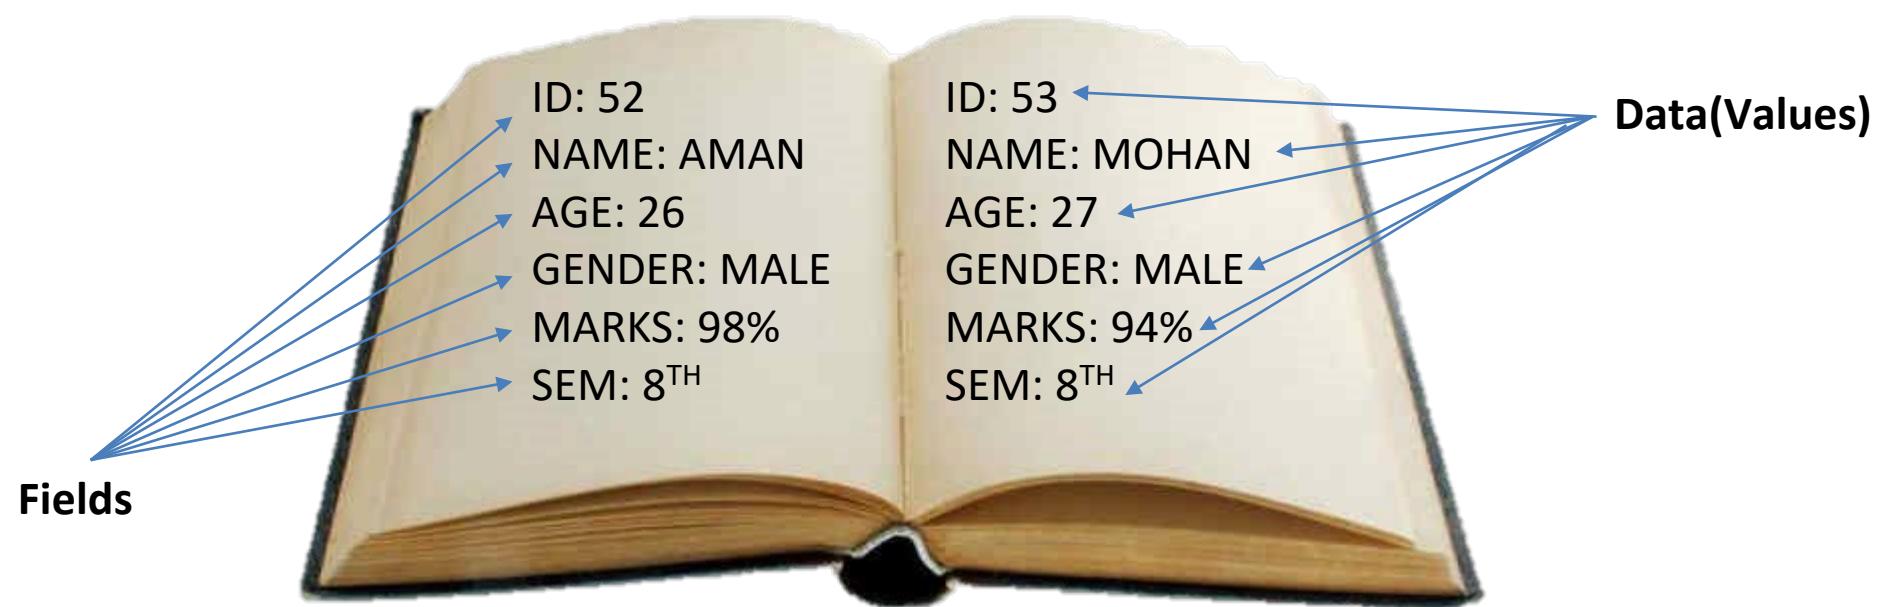

Introduction

- In 1960s, high level programming language developers suggested to make use of programming languages to manage(store and retrieve) the facts and figures.
- In programming languages there is a concept called datatypes, variables and arrays. One can make use of it and can store facts and figures.
- People were very happy because computers do not have disadvantages like LEDGERS, and now they have a way to store facts and figures in computers and they started to store facts & figures in computers using programming languages.
- But as the size of facts & figures increased, programming languages failed to manage it.
- Programming languages are successful only in managing (storing and retrieving) data (small volumes of facts and figures) but not database(large volumes of facts & figures).

Introduction

DBMS – It is a Software which is used to (manage) store data permanently and retrieve the large amount of data efficiently.

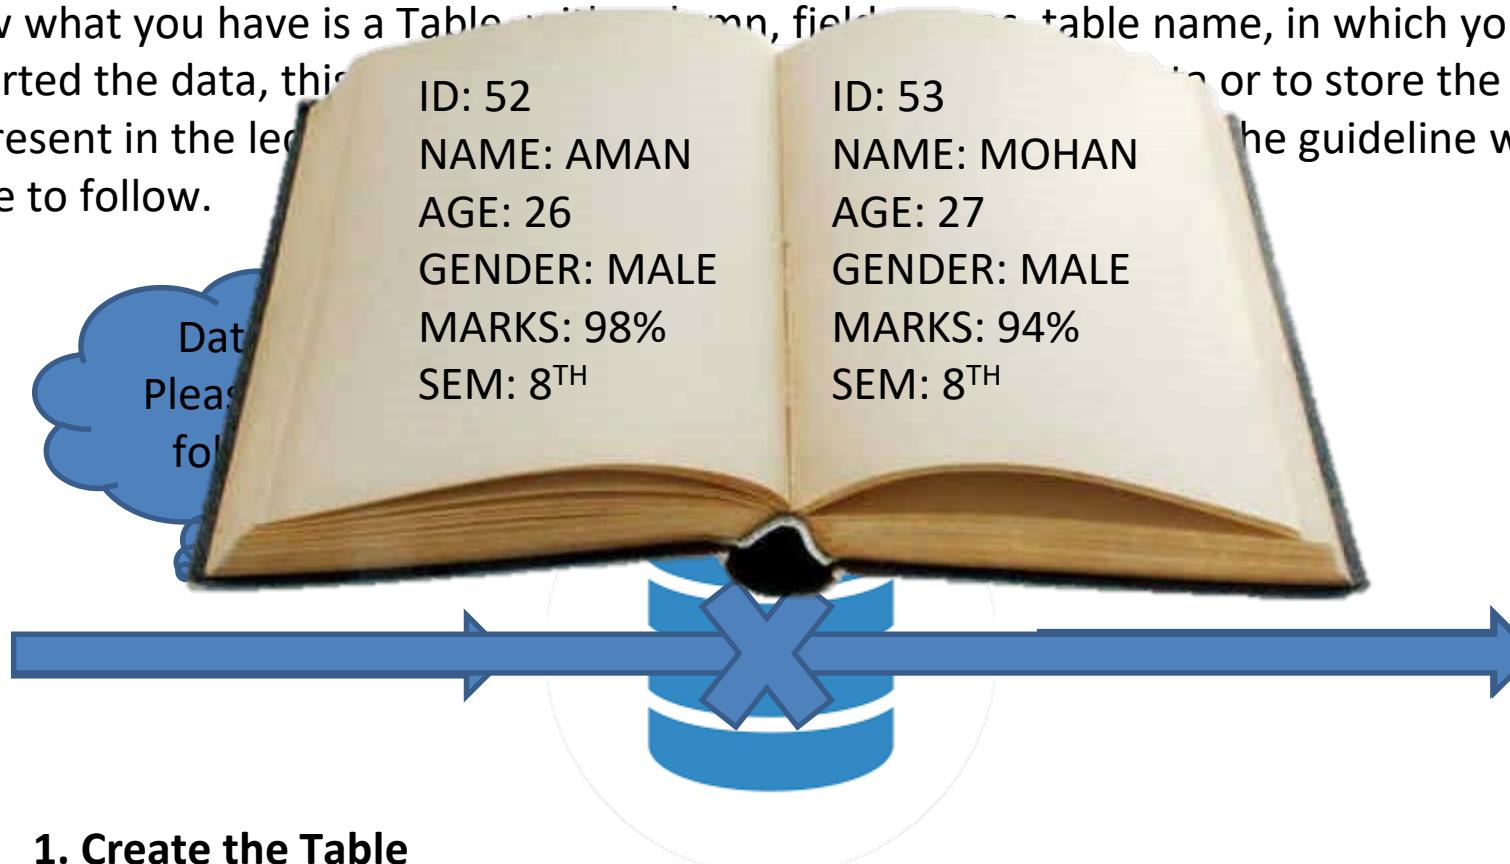

For Ex: **Oracle**, MySQL, DB2, Informix etc..

Now what you have is a Table with column, fields. This is the table name, in which you have inserted the data, this is present in the ledger. So, here are the guidelines which you have to follow.

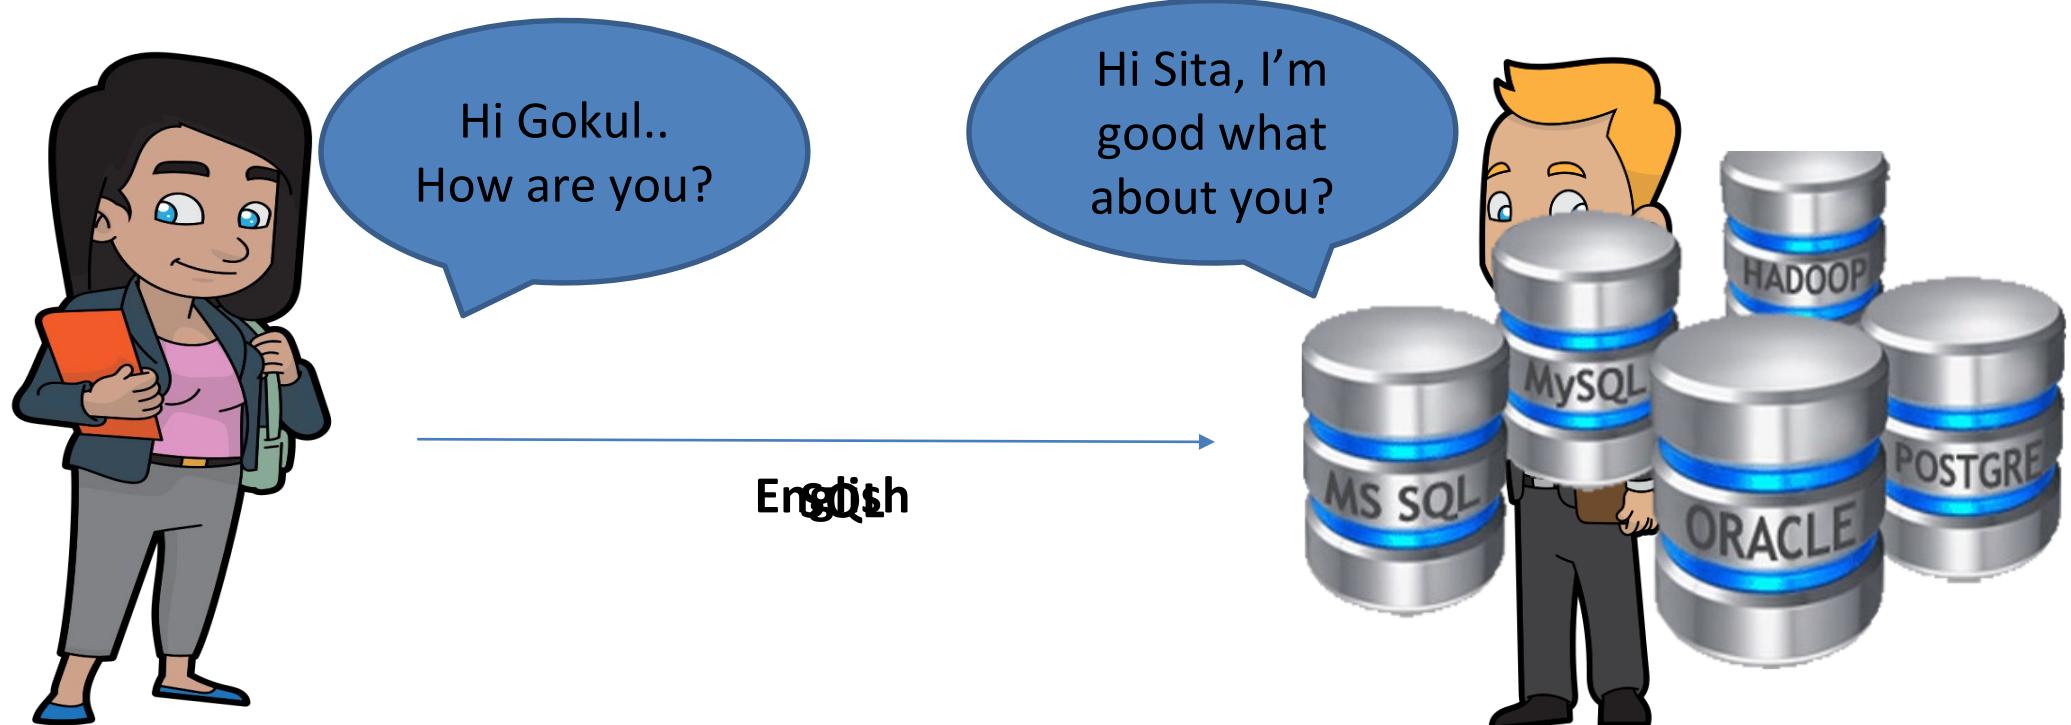

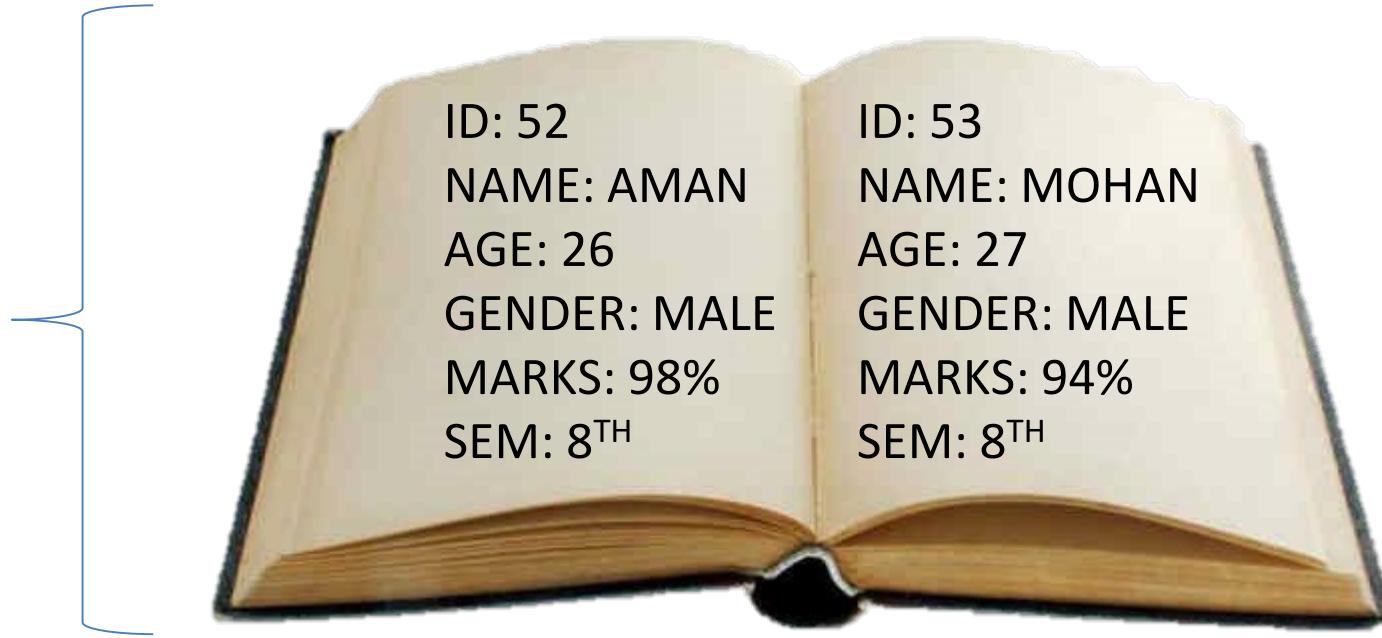

Data
Please
follow

- 1. Create the Table**
- 2. The field of the ledger should be the columns of a Table**
- 3. Give a name to the Table**
- 4. Insert the data inside the Table**

SQL – It is a Language used to communicate with Database Management System.
We will be using **Oracle DBMS** to store our Data.

Using SQL

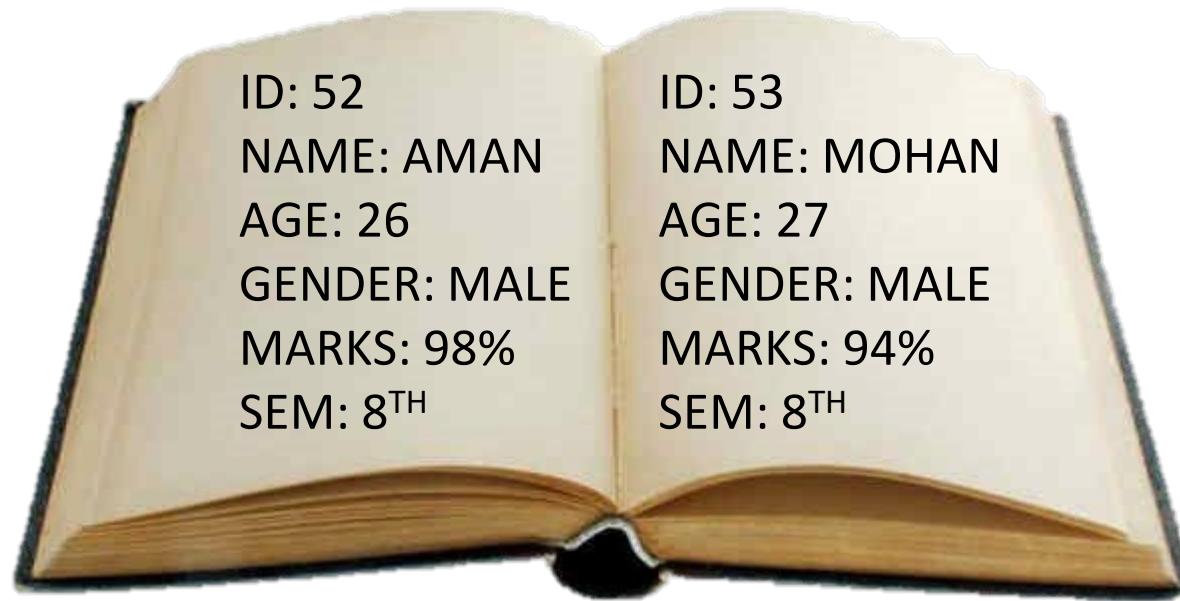

DBMS

ID	NAME	AGE	GENDER	MARKS	SEM
52	AMAN	26	MALE	98%	8 TH
53	MOHAN	27	MALE	94%	8 TH

Creation of Table

Creation of Table

1. How to insert data into the DBMS by creating the table

```
CREATE TABLE Student
(
    ID number(10),
    Name varchar2(30),
    Age number,
    Gender varchar2(6),
    Marks number,
    SEM number
);
```

ID	NAME	AGE	GENDER	MARKS	SEM

Creation of Table

```
CREATE TABLE Employee  
(  
EmployeeID number(10),  
Name varchar2(30),  
Age number,  
Address varchar2(30),  
Salary number,  
Department number,  
Experience number  
);
```

EmployeeID	Name	Age	Address	Salary	Department	Experience

Creation of Table

2. Now, Let's see how to Insert the data into the table

```
INSERT INTO Student VALUES( 52, 'AMAN', 26, 'MALE', 98, 8 );
```

```
INSERT INTO Student VALUES( 53, 'MOHAN', 27, 'MALE', 94, 8 );
```

ID	NAME	AGE	GENDER	MARKS	SEM
52	AMAN	26	MALE	98%	8 TH
53	MOHAN	27	MALE	94%	8 TH

Creation of Table

```
INSERT INTO STUDENTS (ID, NAME, AGE, GENDER, MARKS, SEM) VALUES (54, ABHIRAM, 22, MALE, 85, 7);
INSERT INTO STUDENTS (ID, NAME, AGE, GENDER, MARKS, SEM) VALUES (55, ALKA, 20, FEMALE, 78, 7);
INSERT INTO STUDENTS (ID, NAME, AGE, GENDER, MARKS, SEM) VALUES (56, DISHA, 21, FEMALE, 91, 8);
INSERT INTO STUDENTS (ID, NAME, AGE, GENDER, MARKS, SEM) VALUES (57, ESHA, 21, FEMALE, 89, 8);
```

ID	NAME	AGE	GENDER	MARKS	SEM
54	ABHIRAM	22	MALE	85	7
55	ALKA	20	FEMALE	78	7
56	DISHA	21	FEMALE	91	8
57	ESHA	21	FEMALE	89	8

Oracle setup and Installation

Relational Model

Relational Model

Roll Number		Student Name		Marks Obtained		
1	1	Rohit	Rohit	1	45	45
2	2	Mohan	Mohan	2	78	78
3	3	Sanjay	Sanjay	3	89	89
4	4	Kiran	Kiran	4	56	56

Relational Model

Country	Capital
Greece	Athens
Italy	Rome
USA	Washington
China	Beijing
Japan	Tokyo
Australia	Sydney
France	Paris

Country	Currency
Greece	Drachma
Italy	Lira
USA	Dollar
China	Renminbi (Yuan)
Japan	Yen
Australia	Australian Dollar
France	Francs

Relational Model

Term	Meaning
Relation	A table
Tuple	A row or a record in a relation
Attribute	A field or a column in a relation
Cardinality of a relation	The number of tuples in a relation
Degree of a relation	The number of attributes in a relation
Domain of an attribute	The set of all values that can be taken by the attribute
Primary Key of a relation	An attribute or a combination of attributes that uniquely defines each tuple in a relation
Foreign Key	An attribute or a combination of attributes in one relation R1 that indicates the relationship of R1 with another relation R2. The foreign key attributes in R1 must contain values matching with those of the values in R2

Miscellaneous topics

Projection

Projection means choosing which columns (or expressions) the query shall return.

Projection is a process of displaying the result using project queries.

Project queries are all those queries which is used to display(Project) particular columns to the user based on the requirement from the user.

USN	NAME	GENDER	AGE	MARKS
120	RAM	MALE	21	85
121	RAVI	MALE	20	88
122	KAVITHA	FEMALE	22	90
123	ARJUN	MALE	22	87
124	ANJUNA	FEMALE	21	75

Projection

Q1. Write a query to display AGE and MARKS of all the students.

Autocommit Display ▾

```
SELECT AGE, MARKS FROM STUDENT;
```

Results Explain Describe Saved SQL History

AGE	MARKS
21	85
20	88
22	90
22	87
21	75

Projection

Q2. Write a query to display NAME and USN of the student whose age is greater than 21.

Autocommit Display 10 ▾

```
SELECT NAME, USN FROM STUDENT WHERE AGE>21;
```

Results Explain Describe Saved SQL History

NAME	USN
KAVITHA	122
ARJUN	123

Selection

Selection means which rows are to be returned.

Selection is the process of displaying the result using select queries.

Select queries are those queries which displays particular rows to the user base on specific condition/s.

Q3. Write a query to display all the information of student named “KAVITHA”.

The screenshot shows a MySQL Workbench interface. At the top, there is a toolbar with an 'Autocommit' checkbox checked, a 'Display' dropdown set to '10', and a dropdown arrow. Below the toolbar, a SQL query is entered:

```
SELECT * FROM STUDENT WHERE NAME='KAVITHA';
```

At the bottom of the interface, there is a navigation bar with tabs: 'Results' (which is highlighted in green), 'Explain', 'Describe', 'Saved SQL', and 'History'.

USN	NAME	GENDER	AGE	MARKS
122	KAVITHA	FEMALE	22	90

Selection

Q4. Write a query to display NAME, GENDER and USN of student named “RAVI”.

Autocommit Display 10 ▾

```
SELECT NAME, GENDER, USN FROM STUDENT WHERE NAME='RAVI';
```

Results Explain Describe Saved SQL History

NAME	GENDER	USN
RAVI	MALE	121

Case Sensitivity in SQL

The **SQL** Keywords are **case-insensitive** (SELECT, FROM, WHERE, AS, ORDER BY, HAVING, GROUP BY, etc), but are usually written in all capitals.

- 1.KEYWORDS IN SQL IS NOT CASE SENSITIVE.**
- 2.TABLE NAMES IN SQL ARE NOT CASE SENSITIVE.**
- 3.COLUMN NAMES IN SQL ARE NOT CASE SENSITIVE.**
- 4.DATA IN SQL IS CASE SENSITIVE.**

Case Sensitivity in SQL

COLUMN NAMES

A screenshot of a MySQL command-line interface. The query entered is:

```
Select nAME, AgE FROm StuDent wheRe NaMe = 'RAVI';
```

The words 'nAME', 'AgE', 'StuDent', and 'NaMe' are underlined in red, indicating they are case-sensitive column names. The word 'RAVI' is also underlined in red, indicating it is a case-sensitive value.

KEYWORDS

Results Explain Describe Saved SQL History

NAME	AGE
RAVI	20

DATA

Case Sensitivity in SQL

WRONG DATA

The screenshot shows a MySQL command-line interface. At the top, there's a toolbar with an 'Autocommit' checkbox checked, a 'Display' dropdown set to '10', and a dropdown arrow. Below the toolbar, the SQL query 'Select nAME, AgE FROm StuDent wheRe NaMe = 'RaVi'' is entered. A red underline is underlined under every word in the query except for the column names 'nAME' and 'AgE'. A blue arrow points from the word 'RaVi' in the WHERE clause to the text 'WRONG DATA' at the top right. The main area below the query is empty, indicating no results.

```
Select nAME, AgE FROm StuDent wheRe NaMe = 'RaVi';
```

[Results](#) [Explain](#) [Describe](#) [Saved SQL](#) [History](#)

no data found

Datatypes

A data type specifies a particular type of data, such as integer, floating-point, Boolean etc.

A data type also specifies the possible values for that type, the operations that can be performed on that type and the way the values of that type are stored.

Oracle provides the following built-in datatypes:

Character Datatypes

CHAR Datatype

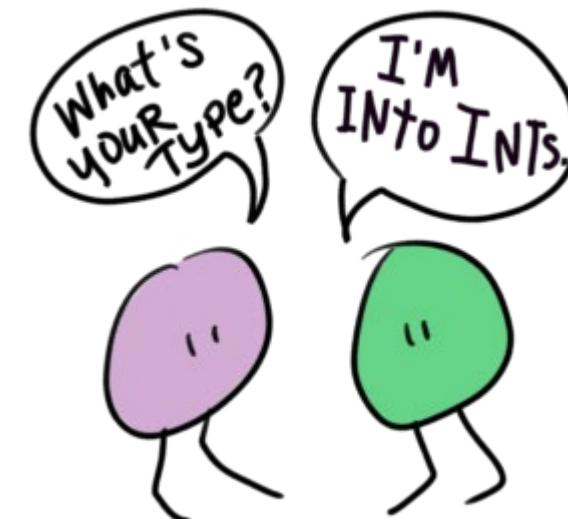

VARCHAR2 and VARCHAR Datatypes

LONG Datatype

NUMBER Datatype

FLOAT Datatype

DATE Datatype

Datatypes

Datatype	Description	Column Length and Default
CHAR (<i>size</i>)	Fixed-length character data of length <i>size</i> bytes.	Fixed for every row in the table (with trailing blanks); maximum size is 2000 bytes per row, default size is 1 byte per row. Consider the character set (one-byte or multibyte) before setting <i>size</i> .
VARCHAR (<i>size</i>)	Variable-length character data. A maximum <i>size</i> must be specified.	Variable for each row, up to 2000 bytes per row. Consider the character set (one-byte or multibyte) before setting <i>size</i> . If we declare datatype as VARCHAR then it will occupy space for NULL values.
VARCHAR2 (<i>size</i>)	Variable-length character data. A maximum <i>size</i> must be specified.	Variable for each row, up to 4000 bytes per row. Consider the character set (one-byte or multibyte) before setting <i>size</i> . If we declare datatype as VARCHAR2 then it will not occupy any space for NULL values.

Datatypes

Datatype	Description	Column Length and Default
NUMBER [(p [, s])]	Variable-length numeric data. Range of p : From 1 to 38. Range of s : from -84 to 127.	Variable for each row. The maximum space required for a given column is 21 bytes per row.
FLOAT [(p)]	A subtype of the NUMBER datatype having precision p . The precision p can range from 1 to 126 binary digits.	A FLOAT value is represented internally as NUMBER. A FLOAT value requires from 1 to 22 bytes.
DATE	Fixed-length date and time data, Valid date range : From January 1, 4712 BC, to December 31, 9999 AD. The default format is determined explicitly by the NLS_DATE_FORMAT parameter or implicitly by the NLS_TERRITORY parameter.	Fixed at 7 bytes for each row in the table. Default format is a string (such as DD-MON-YY) specified by NLS_DATE_FORMAT parameter.

Operators

An operator is a reserved word or a character used primarily in an SQL statement's WHERE clause to perform operation(s), such as comparisons and arithmetic operations. These Operators are used to specify conditions in an SQL statement and to serve as conjunctions for multiple conditions in a statement.

OPERATOR	NAME	PRECEDANCE
+	ADD	3
-	SUB	4
*	MUL	1
/	DIV	2

Column Alias

Shubham Agarwal

AKA

Monu

USN	NAME	GENDER	AGE	MARKS
120	RAM	MALE	21	85
121	RAVI	MALE	20	88
122	KAVITHA	FEMALE	22	90
123	ARJUN	MALE	22	87
124	ANJUNA	FEMALE	21	75

REGISTRATION_NUMBER	NAME	GENDER	YEARS_OLD	SCORE
120	RAM	MALE	21	85
121	RAVI	MALE	20	88
122	KAVITHA	FEMALE	22	90
123	ARJUN	MALE	22	87
124	ANJUNA	FEMALE	21	75

Column Alias

Aliases are the other names given to columns in SQL.

Whenever aliases names have to be specified for columns then following syntax has to be used

columnname as aliasname

or

columnname “alias name”

NOTE : The alias names will never be reflected in the actual tables present on the hard disk of the computer.

Column Alias

Autocommit Display 10 ▾

```
SELECT USN AS REGISTRATION_NUMBER, NAME, GENDER, AGE AS YEARS_OLD, MARKS AS SCORE FROM STUDENT;
```

Results Explain Describe Saved SQL History

REGISTRATION_NUMBER	NAME	GENDER	YEARS_OLD	SCORE
120	RAM	MALE	21	85
121	RAVI	MALE	20	88
122	KAVITHA	FEMALE	22	90

Distinct Keyword

USN	NAME	GENDER	AGE	MARKS
120	RAM	MALE	21	85
121	RAVI	MALE	20	88
122	KAVITHA	FEMALE	22	90
123	ARJUN	MALE	22	87
124	ANJUNA	FEMALE	21	75

AGE
22
21
20

Distinct Keyword

There may be a situation when you need to retrieve unique records and not multiple duplicate records.

The SQL DISTINCT keyword is used after SELECT to eliminate duplicate records and fetch only unique records.

Note1:Distinct keyword is used to avoid displaying of repeated values

The screenshot shows a MySQL Workbench interface. At the top, there's a toolbar with an Autocommit checkbox checked, a Display dropdown set to 10, and a dropdown arrow. Below the toolbar is a SQL query window containing the following code:

```
SELECT DISTINCT AGE FROM STUDENT;
```

At the bottom of the interface, there's a navigation bar with tabs: Results (which is selected), Explain, Describe, Saved SQL, and History.

AGE
22
21
20

Concatenation Operator

Note1: The operator `||` is the concatenation operator in SQL.

Note2: Concatenation operator is used to combine multiple data or multiple columns.

USN	NAME	GENDER	AGE	MARKS
120	RAM	MALE	21	85
121	RAVI	MALE	20	88
122	KAVITHA	FEMALE	22	90

RAVI AGED 20
KAVITHA AGED 22
ARJUN AGED 22
ANJUNA AGED 21

CONCATENATION

DUAL table

The DUAL table is a special one-row, one-column table present by default in Oracle and other database installations.

In Oracle, the table has a single VARCHAR2(1) column called DUMMY that has a value of 'X'.

if the query “select * from dual” is executed then following will be the output :

The screenshot shows a SQL development environment with the following interface elements:

- Autocommit:** Checked.
- Display:** Set to 10.
- SQL Statement:** `SELECT * FROM DUAL;`
- Results Tab:** Active tab, showing the output of the query.
- Output:** A single row with one column named "DUMMY" containing the value "X".

DUAL table

Want to see how DUAL table looks like or what is the structure ?

Autocommit **Display** 10 ▾

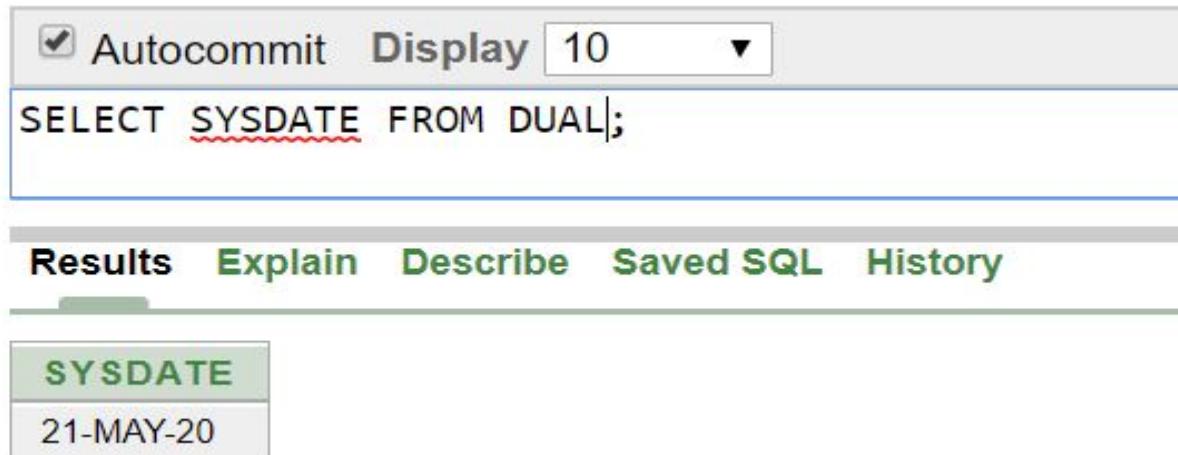

DESC DUAL;

[Results](#) [Explain](#) [Describe](#) [Saved SQL](#) [History](#)

Object Type TABLE Object DUAL

DUAL table

You can also check the system date from the DUAL table using the following statement

The screenshot shows a SQL query being run in an Oracle database. The query is:

```
SELECT SYSDATE FROM DUAL;
```

The results section shows the output:

SYSDATE
21-MAY-20

DUAL table

You can also check the arithmetic calculation from the DUAL table using the following statement

The screenshot shows a SQL query interface. At the top, there is a toolbar with an 'Autocommit' checkbox checked, a 'Display' dropdown set to '10', and a dropdown arrow. Below the toolbar, the SQL query 'SELECT 18+52-7*4/9 FROM DUAL;' is entered. Underneath the query, there is a navigation bar with tabs: 'Results' (which is highlighted in green), 'Explain', 'Describe', 'Saved SQL', and 'History'. The results section displays the query '18+52-7*4/9' in a header row, followed by a single result row containing the value '66.8888888888888888888888888888888889'.

```
SELECT 18+52-7*4/9 FROM DUAL;
```

Results Explain Describe Saved SQL History

66.8888888888888888888888888888888889

Operators as keywords

Relational Operators

A comparison (or **relational**) operator is a mathematical symbol which is used to compare two values.

Operator	Description
=	Equal to
>	Greater than
<	Lesser than
>=	Greater than or equal to
<=	Lesser than or equal to
!=	Not equal to
<>	Not equal to
^ =	Not equal to

Relational Operators

USN	NAME	GENDER	AGE	MARKS
120	RAM	MALE	21	85
121	RAVI	MALE	20	88
122	KAVITHA	FEMALE	22	90
123	ARJUN	MALE	22	87
124	ANJUNA	FEMALE	21	75

Q1. Write a query to display USN, NAME and AGE of all the students whose age is equal to 22.

Q2. Write a query to display USN, NAME and AGE of all the students whose age is greater than 20.

Q3. Write a query to display USN, NAME and AGE of all the students whose age is lesser than 22.

Relational Operators

Q4. Write a query to display USN, NAME and AGE of all the students whose age is greater than and equal to 20.

Q5. Write a query to display USN, NAME and AGE of all the students whose age is lesser than or equal to 22.

Q6. Write a query to display USN, NAME and AGE of all the students whose age is not equal to 20.

Operator	Precedence
=	1
>	2
<	3
>=	4
<=	5
!=	6
<>	6
^ =	6

Operators as keywords

1. BETWEEN AND OPERATOR

When the condition has a range of values to be compared we should be using BETWEEN AND operator.

Q. Write a query to display all the information of the students whose MARKS is in between 80 and 90 from the STUDENT table.

The screenshot shows a MySQL Workbench interface. At the top, there is a toolbar with an 'Autocommit' checkbox checked, a 'Display' dropdown set to '10', and a dropdown arrow. Below the toolbar, a SQL query is entered:

```
SELECT * FROM student WHERE MARKS BETWEEN 80 AND 90;
```

Below the query, there is a horizontal navigation bar with tabs: 'Results' (which is highlighted in green), 'Explain', 'Describe', 'Saved SQL', and 'History'. Under the 'Results' tab, a table is displayed with the following data:

USN	NAME	GENDER	AGE	MARKS
120	RAM	MALE	21	85
121	RAVI	MALE	20	88
122	KAVITHA	FEMALE	22	90
123	ARJUN	MALE	22	87

Operators as keywords

Autocommit Display 10 ▾

```
SELECT * FROM student WHERE MARKS BETWEEN 90 AND 80;
```

Results Explain Describe Saved SQL History

no data found

If we use higher value first and lower value after that, then “no data found” will be the output.

If we want to get the output for data which doesn't come in the range of given values.

Autocommit Display 10 ▾

```
SELECT * FROM student WHERE MARKS NOT BETWEEN 80 AND 90;
```

Results Explain Describe Saved SQL History

USN	NAME	GENDER	AGE	MARKS
124	ANJUNA	FEMALE	21	75

Operators as keywords

2. IN OPERATOR

When ever comparison has to be done with respect to a set of values we have to use the IN operator.

Q. Write a query to display all the information of the students whose AGE is 20 and 22 from the STUDENT table.

The screenshot shows a MySQL Workbench interface. At the top, there's a toolbar with an 'Autocommit' checkbox checked, a 'Display' dropdown set to '10', and a dropdown arrow. Below the toolbar is a query editor containing the following SQL statement:

```
SELECT * FROM student WHERE AGE IN (20,22);
```

Below the query editor is a navigation bar with tabs: Results (which is selected), Explain, Describe, Saved SQL, and History. Under the 'Results' tab, there is a table displaying student data:

USN	NAME	GENDER	AGE	MARKS
121	RAVI	MALE	20	88
122	KAVITHA	FEMALE	22	90
123	ARJUN	MALE	22	87

Operators as keywords

3. LIKE KEYWORD

The LIKE operator is used to search for a specified pattern in a column.

Note: Pattern matching in SQL

There are two pattern matching symbols in sql

- 1) % (modulus) it matches 0 or more characters
- 2) _ (underscore) it matches exactly one character

Operators as keywords

Q. Write a query to display all the details of the student whose names start with “Ra”.

The screenshot shows a MySQL query interface. At the top, there is a checkbox labeled "Autocommit" which is checked, and a dropdown menu labeled "Display" set to "10". Below this, a SQL query is entered:

```
SELECT * FROM student WHERE NAME LIKE 'RA%';
```

Below the query, there is a navigation bar with tabs: "Results" (which is highlighted in green), "Explain", "Describe", "Saved SQL", and "History". Under the "Results" tab, a table is displayed with the following data:

USN	NAME	GENDER	AGE	MARKS
120	RAM	MALE	21	85
121	RAVI	MALE	20	88

Operators as keywords

Q24. Write a query to display all the details of the students whose names fourth character is “I” from the STUDENT table.

Autocommit Display 10 ▾

```
SELECT * FROM student WHERE NAME LIKE '__I%';
```

Results Explain Describe Saved SQL History

USN	NAME	GENDER	AGE	MARKS
121	RAVI	MALE	20	88
122	KAVITHA	FEMALE	22	90

Operators as keywords

4. IS NULL OPERATOR

It is used to select only the records with NULL values in the column

Q. Write a query to display all the details of the student whose age is null from student table.

USN	NAME	GENDER	AGE	MARKS
120	RAM	MALE	21	85
121	RAVI	MALE	20	88
122	KAVITHA	FEMALE	22	90
123	ARJUN	MALE	22	87
124	ANJUNA	FEMALE	21	75
125	SONAL	FEMALE	-	89
126	ROHAN	MALE	-	95
127	MANISHA	FEMALE	25	85

UPDATED TABLE

Operators as keywords

Q. Write a query to display all the details of the student whose age is null from student table.

The screenshot shows a MySQL Workbench interface. At the top, there is a toolbar with an 'Autocommit' checkbox checked and a 'Display' dropdown set to 10. Below the toolbar is a query editor containing the SQL statement: `SELECT * FROM STUDENT WHERE AGE IS NULL;`. Underneath the query editor is a navigation bar with tabs: 'Results' (which is selected), 'Explain', 'Describe', 'Saved SQL', and 'History'. A horizontal line separates the navigation bar from the results table. The results table has a header row with columns: USN, NAME, GENDER, AGE, and MARKS. There are two data rows: the first row contains USN 125, NAME SONAL, GENDER FEMALE, AGE -, and MARKS 89; the second row contains USN 126, NAME ROHAN, GENDER MALE, AGE -, and MARKS 95.

USN	NAME	GENDER	AGE	MARKS
125	SONAL	FEMALE	-	89
126	ROHAN	MALE	-	95

Operators as keywords

5. LOGICAL OPERATORS

OPERATORS	DESCRIPTION
AND	TRUE if all the conditions separated by AND is TRUE
OR	TRUE if any of the conditions separated by OR is TRUE
NOT	Displays a record if the condition(s) is NOT TRUE

Q. Write a query to display all the details of the students whose marks is greater than 85 and their names should not start with “R” from STUDENT table.

Operators as keywords

Q. Write a query to display all the details of the students whose marks is greater than 85 and their names should not start with “R” from STUDENT table.

Autocommit Display 10 ▾

```
SELECT * FROM STUDENT WHERE MARKS>85 AND NAME NOT LIKE 'R%';
```

Results Explain Describe Saved SQL History

USN	NAME	GENDER	AGE	MARKS
122	KAVITHA	FEMALE	22	90
123	ARJUN	MALE	22	87
125	SONAL	FEMALE	-	89

Functions

Functions

In SQL we have two types functions :

- 1) Single row functions**
- 2) Multiple row functions**

Single row functions are such functions which will accept a single row as input (or) it accept multiple row as input but produces one result per row.

Multiple row functions/group functions/aggregate functions : are such functions which will accept a single row or multiple row as input but produces one result per group.

Functions

Q. Write a query to display NAME of all the students in lowercase letters from the table STUDENT.

Autocommit Display 10 ▾

```
SELECT LOWER(NAME) FROM STUDENT;
```

Results Explain Describe Saved SQL History

LOWER(NAME)
ram
ravi
kavitha
arjun
anjuna
manisha
sonal
rohan

Functions

Q. Write a query to display Initial letter capital of data 'RITWIK'.

Autocommit Display 10 ▾

```
SELECT INITCAP('RITWIK') AS "INITIAL" FROM DUAL;
```

Results Explain Describe Saved SQL History

INITIAL
Ritwik

Functions

Q. Write a query to display all the names and gender of the students in lowercase where gender is 'MALE'.

Autocommit Display 10 ▾

```
SELECT LOWER(NAME), LOWER(GENDER) FROM STUDENT WHERE GENDER = 'MALE';
```

Results Explain Describe Saved SQL History

LOWER(NAME)	LOWER(GENDER)
ram	male
ravi	male
arjun	male
rohan	male

Functions

Q. Write a query to concatenate data 'Ritwik' & 'Raj'.

Autocommit Display 10 ▾

```
SELECT 'RITWIK' || 'RAJ' FROM DUAL;
SELECT CONCAT('RITWIK','RAJ') FROM DUAL;
```

Results Explain Describe Saved SQL History

'RITWIK' 'RAJ'
RITWIKRAJ

Functions

Q. Write a query to find the length of the string ‘Ritwik’.

The screenshot shows a SQL query execution interface. At the top, there is a checkbox labeled "Autocommit" which is checked, and a dropdown menu labeled "Display" set to "10". Below this, the SQL query "SELECT LENGTH('Ritwik') FROM DUAL;" is entered. Underneath the query, there is a horizontal navigation bar with links: "Results" (which is underlined in red), "Explain", "Describe", "Saved SQL", and "History". The results section displays a single row with the header "LENGTH('RITWIK')" and the value "6".

LENGTH('RITWIK')
6

Functions

Q. Write a query to display the substring of the string ‘Sudeshna’ from 3rd position extract 6 characters.

The screenshot shows a SQL query execution interface. At the top, there is a checkbox labeled "Autocommit" which is checked, and a dropdown menu labeled "Display" with the value "10". Below this, the SQL query is written:

```
SELECT SUBSTR('Sudeshna',3,6) FROM DUAL;
```

Below the query, there is a navigation bar with tabs: "Results", "Explain", "Describe", "Saved SQL", and "History". The "Results" tab is selected, indicated by a green underline. The results section displays the output of the query:

SUBSTR('SUDESHNA',3,6)
deshna

Functions

Q. Write a query to display the position of the character 'a' in the string 'Chatterjee'.

The screenshot shows a SQL query being run in an Oracle database. The query is:

```
SELECT INSTR('Chatterjee', 'a') FROM DUAL;
```

The results section shows the output of the query:

INSTR('CHATTERJEE','A')
3

Functions

Q. Write a query to trim the leading 'a' in the string 'akash'.

Autocommit Display 10 ▾

```
SELECT TRIM(leading 'a' from 'akash') FROM DUAL;
```

Results Explain Describe Saved SQL History

TRIM(LEADING'A'FROM'AKASH')
kash

Q. Write a query to trim the trailing 'a' in the string 'angelina'.

Autocommit Display 10 ▾

```
SELECT TRIM(trailing 'a' from 'angelina') FROM DUAL;
```

Results Explain Describe Saved SQL History

TRIM(TRAILING'A'FROM'ANGELINA')
angelin

Functions

Q. Write a query to display the data 'Ritwik' in the format '@@@@Ritwik'.

The screenshot shows a SQL query execution interface. At the top, there is an 'Autocommit' checkbox checked and a 'Display 10' dropdown. Below that is a code input field containing: `SELECT lpad('Ritwik',10, '@') FROM DUAL;`. Underneath the code, there is a horizontal navigation bar with tabs: Results (which is highlighted in green), Explain, Describe, Saved SQL, and History. The results section displays the output of the query: `LPAD('RITWIK',10,'@')` followed by the result: `@@@@@Ritwik`.

Q. Write a query to display the data 'Ritwik' in the format 'Ritwik@{@}'.

The screenshot shows a SQL query execution interface. At the top, there is an 'Autocommit' checkbox checked and a 'Display 10' dropdown. Below that is a code input field containing: `SELECT rpad('Ritwik',10, '@') FROM DUAL;`. Underneath the code, there is a horizontal navigation bar with tabs: Results (which is highlighted in green), Explain, Describe, Saved SQL, and History. The results section displays the output of the query: `RPAD('RITWIK',10,'@')` followed by the result: `Ritwik@{@}`.

Functions

Q. What would be the output of the following query

```
SELECT ROUND(95.528,2) FROM DUAL;
```

Q. What would be the output of the following query

```
SELECT TRUNC(135.256,2) FROM DUAL;
```

Autocommit Display 10

```
SELECT ROUND(95.528,2) FROM DUAL;
```

Results Explain Describe Saved SQL History

ROUND(95.528,2)
95.53

Autocommit Display 10

```
SELECT TRUNC(135.256,2) FROM DUAL;
```

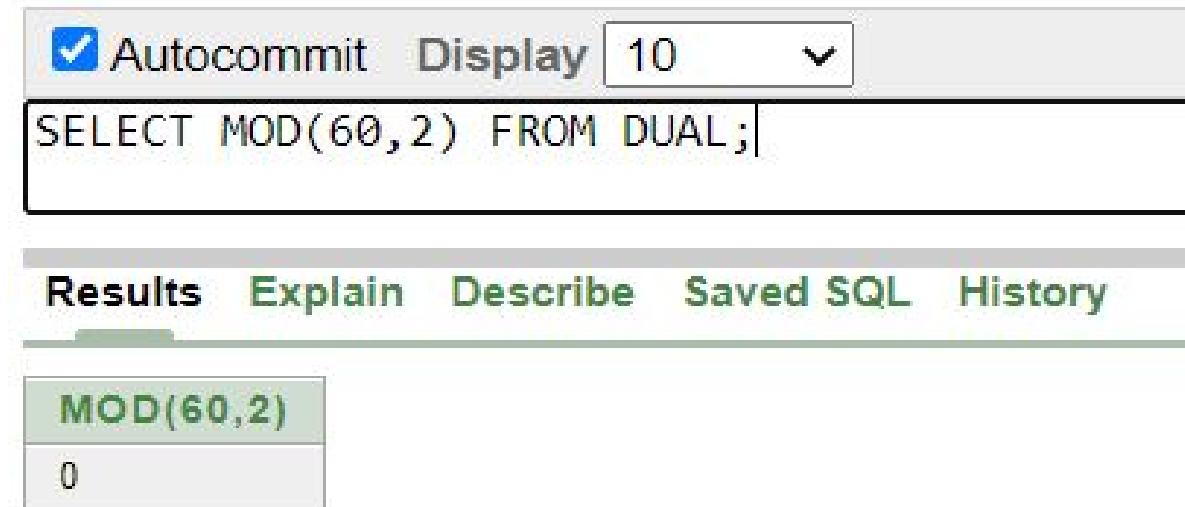

Results Explain Describe Saved SQL History

TRUNC(135.256,2)
135.25

Functions

Q. What would be the output of the following query

SELECT MOD(60,2) FROM DUAL;

The screenshot shows a SQL query execution interface. At the top, there is a checkbox labeled "Autocommit" which is checked, and a dropdown menu labeled "Display" set to "10". Below this is a text input field containing the SQL query: "SELECT MOD(60,2) FROM DUAL;". Underneath the query, there is a horizontal navigation bar with tabs: "Results", "Explain", "Describe", "Saved SQL", and "History". The "Results" tab is highlighted with a green background. Below the tabs, the result of the query is displayed in a table. The table has one row and two columns. The first column is labeled "MOD(60,2)" and the second column contains the value "0".

MOD(60,2)	0
MOD(60,2)	0

Functions

Q. Write a query to display the age. If age is null replace it with 0.

Autocommit Display 10 ▾

```
SELECT NVL(AGE,0) FROM STUDENT;
```

Results Explain Describe Saved SQL History

NVL(AGE,0)
21
20
22
22

28
28
28
0
0

Q. Write a query to display the age. If age is null replace it with 0 else replace with 28.

Functions

Q. Write a query to display the number of months between the dates 24-dec-2018 and 24-mar-2018.

The screenshot shows a SQL query being run in an Oracle database. The query is:

```
SELECT MONTHS_BETWEEN('24-DEC-2018', '24-MAR-2018') FROM DUAL;
```

The results pane displays the output of the query:

MONTHS_BETWEEN('24-DEC-2018','24-MAR-2018')
9

Functions

Q. Write a query in order to add 7 months for the date 24-mar-2018.

The screenshot shows a SQL query execution interface. At the top, there is an 'Autocommit' checkbox (checked) and a 'Display' dropdown set to 10. Below this is a code input field containing the following SQL query:

```
SELECT ADD_MONTHS('24-MAR-2018',7) FROM DUAL;
```

Below the code input is a navigation bar with tabs: Results (highlighted), Explain, Describe, Saved SQL, and History. The main results area displays the output of the query:

ADD_MONTHS('24-MAR-2018',7)
24-OCT-18

Functions

Q. Write a query to find the date of the next Friday after the date 14-feb-2014.

The screenshot shows a SQL query execution interface. At the top, there is a checkbox for 'Autocommit' which is checked, and a 'Display' dropdown set to 10. Below this is a text input field containing the SQL query:

```
SELECT NEXT_DAY('14-FEB-14','FRIDAY') FROM DUAL;
```

Below the query input is a navigation bar with links: 'Results' (which is underlined in green), 'Explain', 'Describe', 'Saved SQL', and 'History'. The 'Results' tab is active. The results table has one row with the following data:

NEXT_DAY('14-FEB-14','FRIDAY')
21-FEB-14

Functions

The Oracle NULLIF() function accepts two arguments. It returns a null value if the two arguments are equal.

In case the arguments are not equal, the NULLIF() function returns the first argument.

Autocommit Display ▾

Clauses

Clauses

USN	NAME	GENDER	AGE	MARKS
120	RAM	MALE	21	85
121	RAVI	MALE	20	88
122	KAVITHA	FEMALE	22	90
123	ARJUN	MALE	22	87
124	ANJUNA	FEMALE	21	75
125	SONAL	FEMALE	-	89
126	ROHAN	MALE	-	95
127	MANISHA	FEMALE	25	85

Student Table

Q. Write a query to display all the details of all the students in the order of AGE from STUDENT table.

Order By

The output of the SQL query can be predicted but the order in which the rows get displayed cannot be predicted.

If we have to print the output in a specific order we should be using order by clause

Syntax:

order by column_name [asc/desc]

The screenshot shows a MySQL Workbench interface. At the top, there is an 'Autocommit' checkbox checked, a 'Display' dropdown set to 10, and a query editor containing the SQL statement: 'SELECT * FROM STUDENT ORDER BY AGE;'. Below the query editor is a toolbar with tabs: 'Results' (which is selected), 'Explain', 'Describe', 'Saved SQL', and 'History'. The results section displays a table with the following data:

USN	NAME	GENDER	AGE	MARKS
121	RAVI	MALE	20	88
124	ANJUNA	FEMALE	21	75
120	RAM	MALE	21	85
122	KAVITHA	FEMALE	22	90
123	ARJUN	MALE	22	87
127	MANISHA	FEMALE	25	85
125	SONAL	FEMALE	-	89
126	ROHAN	MALE	-	95

Group By

Q. Write a query to display AGE and the least marks scored by each UNIQUE aged student from the table STUDENT.

Autocommit Display 10 ▾

```
SELECT AGE, MIN(MARKS) FROM STUDENT GROUP BY AGE;
```

Results Explain Describe Saved SQL History

AGE	MIN(MARKS)
22	87
25	85

21	75
20	88

Group By

Q. Write a query to display GENDER and the least marks scored by each UNIQUE gender student from the table STUDENT.

Autocommit Display 10 ▾

```
SELECT GENDER, MIN(MARKS) FROM STUDENT GROUP BY GENDER;
```

Results Explain Describe Saved SQL History

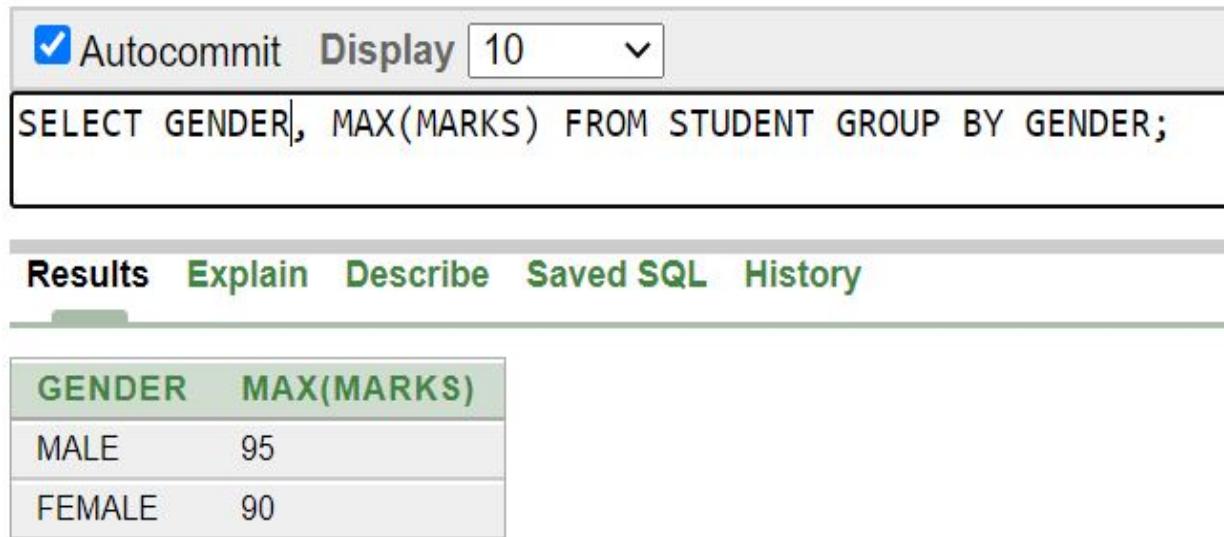

GENDER	MIN(MARKS)
MALE	85
FEMALE	75

Group By

The SQL GROUP BY clause is used in collaboration with the SELECT statement to arrange identical data into groups.

The GROUP BY clause follows the WHERE clause in a SELECT statement and precedes the ORDER BY clause.

The GROUP BY statement is often used with aggregate functions (COUNT, MAX, MIN, SUM, AVG) to group the result-set by one or more columns.

A screenshot of a MySQL command-line interface. At the top, there is a toolbar with an 'Autocommit' checkbox (checked), a 'Display' dropdown set to '10', and a dropdown arrow. Below the toolbar is a text input field containing the SQL query:

```
SELECT GENDER, MAX(MARKS) FROM STUDENT GROUP BY GENDER;
```

Below the text input is a horizontal menu bar with the following options: Results (highlighted in green), Explain, Describe, Saved SQL, and History. A thin horizontal line separates the menu from the results table. The results table has two columns: 'GENDER' and 'MAX(MARKS)'. It contains two rows of data:

GENDER	MAX(MARKS)
MALE	95
FEMALE	90

Group By

Q. Write a query to display AGE and count of the age for all the students whose age is equal to 21 from the table STUDENT.

Autocommit Display

```
SELECT AGE, COUNT(AGE) FROM STUDENT WHERE AGE=21 GROUP BY AGE;
```

123	ARJUN

Nested Query

A Subquery is a query within another SQL query and embedded within the WHERE clause.

A Subquery is used to return data that will be used in the main query as a condition to further restrict the data to be retrieved.

Properties of subqueries

1. Subqueries must be enclosed within parentheses.
2. A subquery can have only one column in the SELECT clause, unless multiple columns are in the main query for the subquery to compare its selected columns.
3. An ORDER BY cannot be used in a subquery, although the main query can use an ORDER BY. The GROUP BY can be used to perform the same function as the ORDER BY in a subquery.
4. Subqueries that return more than one row can only be used with multiple value operators, such as the IN operator.

Nested Query

Q. Write a query to display NAME, AGE whose age is equal to student named RAM and marks is greater than student named ANJUNA from the table STUDENT.

Autocommit Display

```
SELECT NAME, AGE FROM STUDENT WHERE AGE=(SELECT AGE FROM STUDENT WHERE NAME='RAM')AND MARKS>(SELECT MARKS FROM STUDENT WHERE NAME='ANJUNA');
```

What is JOINS in SQL?

Joins

A JOIN is a means for combining fields from two tables (or more) by using values common to each.

Types of JOINS:-

1. Inner Join
2. Left Join
3. Right Join
4. Full Join
5. Natural Join
6. Cross Join

INNER JOIN: Returns all rows when there is at least one match in **BOTH** tables.

LEFT JOIN: Return all rows from the left table, and the matched rows from the right table.

RIGHT JOIN: Return all rows from the right table, and the matched rows from the left table.

FULL JOIN: Return all rows when there is a match in **ONE** of the tables.

INNER JOIN

Join, Inner Join

Write a query to display all the details from EMPLOYEE and EMP_DEPT where the value of EMP_ID in EMPLOYEE is equal to the value Of EMP_ID in EMP_DEPT.

```
SELECT * FROM EMPLOYEE E1 JOIN EMP_DEPT E2 ON E1.EMP_ID = E2.EMP_ID
```

Results Explain Describe Saved SQL History

EMP_ID	NAME	GENDER	AGE	SALARY	DEPT_ID	EMP_ID	DEPARTMENT	CITY	PINCODE
205	VISHAL	MALE	25	560000	21	205	HR	BANGALORE	560076
203	HARPREET	FEMALE	29	890000	23	203	DEVELOPER	DELHI	879009
206	AMAN	MALE	24	350000	23	206	DEVELOPER	PUNE	476501
207	ROHAN	MALE	28	700000	22	207	SALES	BANGALORE	568077
201	RAM	MALE	23	358000	21	201	HR	PUNE	564487
210	PRIYANKA	FEMALE	27	650000	22	210	SALES	MUMBAI	656009

LEFT JOIN

Left Join, Left Outer Join

Write a query to display all the details from EMPLOYEE and common details from EMP_DEPT by using left join keyword.

```
SELECT * FROM EMPLOYEE E1 LEFT OUTER JOIN EMP_DEPT E2 ON E1.EMP_ID = E2.EMP_ID
```

Results Explain Describe Saved SQL History

EMP_ID	NAME	GENDER	AGE	SALARY	DEPT_ID	EMP_ID	DEPARTMENT	CITY	PINCODE

NATURAL JOIN

Natural Join

A NATURAL JOIN is a JOIN operation that creates an implicit join clause for you based on the common columns in the two tables being joined.

A NATURAL JOIN can be an INNER join, a LEFT join, or a RIGHT join. The default is INNER join.

Natural Join

Write a query to display all the details from EMPLOYEE and EMP_DEPT where the value of EMP_ID in EMPLOYEE is equal to the value of EMP_ID in EMP_DEPT by using natural join keyword.

SELECT * FROM EMPLOYEE NATURAL FULL JOIN EMP_DEPT

Results Explain Describe Saved SQL History

SELF JOIN

Self Join

The SQL SELF JOIN is used to join a table to itself as if the table were two tables.

To join a table itself means that each row of the table is combined with itself and with every other row of the table.

Syntax:-

SELECT a.column_name, b.column_name...

FROM table1 a, table1 b

WHERE a.common_field = b.common_field;

EMP_ID	NAME	GENDER	AGE	SALARY
206	AMAN	MALE	24	350000

SQL Commands

DDL

Data Definition – How to define Data.

- DDL changes the structure of the table like creating a table, deleting a table, altering a table, etc.
- All the command of DDL are auto-committed that means it permanently save all the changes in the database.

CREATE: It is used to create a new table in the database.

Syntax:

```
CREATE TABLE TABLE_NAME (COLUMN_NAME DATATYPES[,...]);
```

DDL

Q1. Write a query to create the table “COURSE” with columns such as “Course_ID”, “Course_Name”, “Course_Duration” and “Course_Faculty”.

Autocommit Display

```
CREATE TABLE COURSE(
    Course_ID NUMBER,
    Course_Name VARCHAR2(30),
    Course_Duration NUMBER,
    Course_Faculty VARCHAR2(30)
);
```

Results Explain Describe Saved SQL History

Table created.

DDL

DROP: It is used to delete both the structure and record stored in the table.

Syntax:

```
DROP TABLE table_name;
```

Q2. Write a query to delete the structure & record of the table “COURSE”.

The screenshot shows a MySQL command-line interface. At the top, there are two checkboxes for 'Autocommit' and 'Display'. Below them, the 'Display' dropdown is set to 10. The main area contains two lines of SQL code: 'DROP TABLE COURSE;' and 'DESC COURSE;'. The first line is executed, resulting in the message 'Table dropped.' below it. The second line is shown in a box, indicating an error: 'Object to be described could not be found.' To the right of the interface, a red error message 'table or view does not exist' is displayed. At the bottom, there are tabs for 'Results', 'Explain', 'Describe', 'Saved SQL', and 'History'. The 'Describe' tab is currently selected.

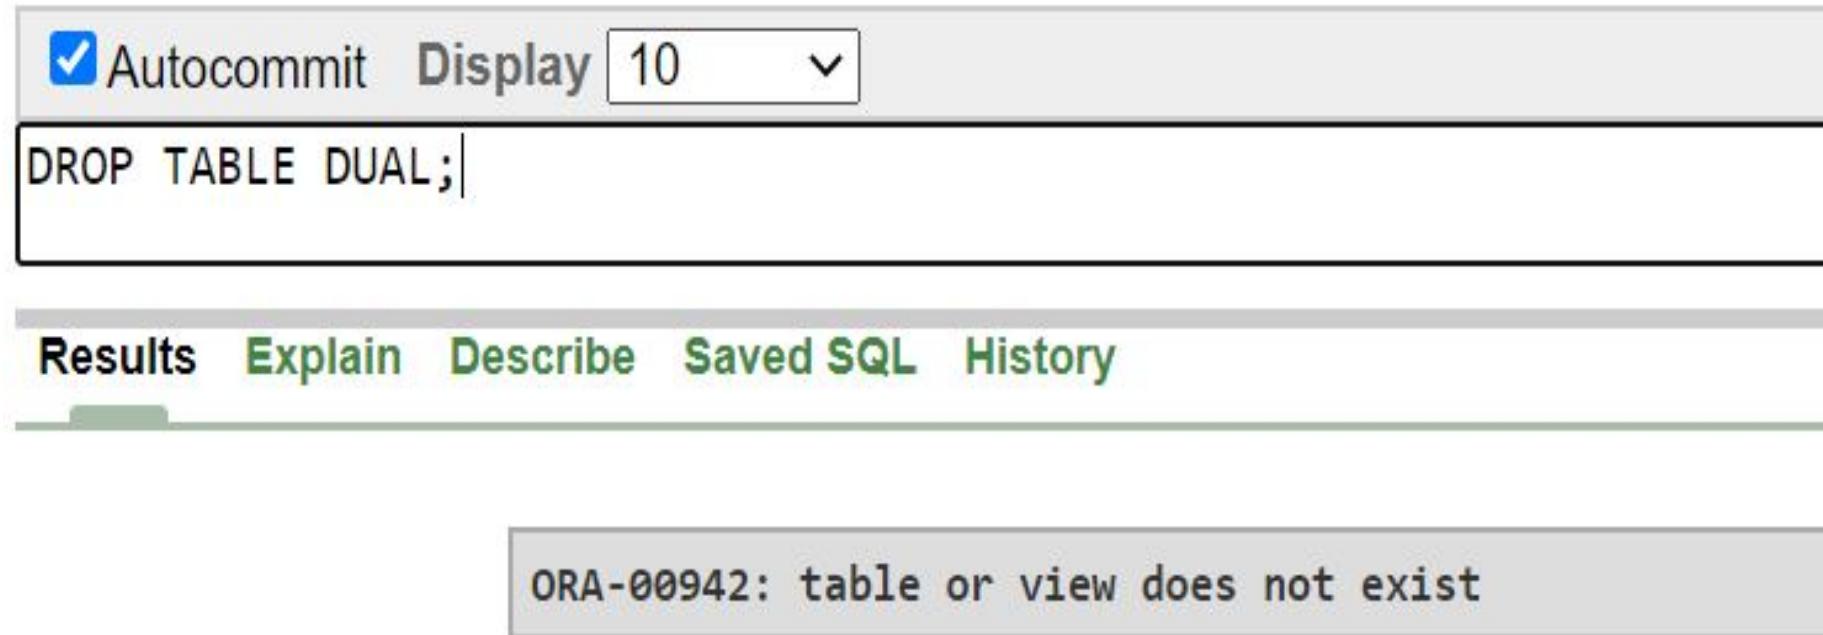

Table dropped.

Object to be described could not be found.

table or view does not exist

DDL

Q3. What happens if we try to DROP dual table ?

The screenshot shows a SQL editor window with the following configuration:

- Autocommit checkbox is checked.
- Display dropdown is set to 10.

The SQL command entered is:

```
DROP TABLE DUAL;
```

The results pane shows the following message:

```
ORA-00942: table or view does not exist
```

DDL

ALTER: It is used to alter the structure of the database. This change could be either to modify the characteristics of an existing attribute or probably to add a new attribute.

Syntax:

To add a new column in the table:

```
ALTER TABLE table_name ADD (column_name COLUMN-definition);
```

To modify existing column in the table:

```
ALTER TABLE table_name MODIFY(column_name COLUMN-definition);
```

To rename existing column name in the table:

```
ALTER TABLE table_name RENAME column old_column_name to new_column_name;
```

DDL

Q4. Write a query to add a new column in the table “COURSE” with columns such as “Course_Fees”.

Autocommit Display 10 ▾

```
ALTER TABLE COURSE ADD (Course_Fees NUMBER(30));
```

Results Explain Describe Saved SQL History

	COURSE_FEES	Number	-	-	-	-	✓

DDL

TRUNCATE: It is used to delete all the rows from the table and free the space containing the table.

Syntax:

```
TRUNCATE TABLE table_name;
```

Q9. Write a query to delete all the rows, not the structure from the table “COURSE”

The screenshot shows a MySQL Workbench interface. At the top, there is a toolbar with buttons for Autocommit, Display, Save, and Run. Below the toolbar, a query editor window contains the command: `DESC COURSE;`. In the background, the results of a previous query are visible, showing the structure of the `COURSE` table. The table has five columns: `COURSE_ID` (Number), `COURSE_NAME` (Varchar2), `COURSE_DURATION` (Number), `COURSE_FACULTY` (Varchar2), and `COURSE_FEES` (Number). All columns are nullable and have a default value of '-'. The primary key is `COURSE_ID`. The results window has tabs for Results, Explain, Describe, Saved SQL, and History. On the left side, there are navigation buttons for Table, Row, and Column, and a sidebar with a history section.

Table	Column	Data Type	Length	Precision	Scale	Primary Key	Nullable	Default	Comment
COURSE	COURSE_ID	Number	-	-	-	-	✓	-	-

DML

Data Manipulation – How to manipulate(inserting, updating and deleting) Data.

- DML commands are used to modify the database. It is responsible for all form of changes in the database.
- The command of DML is not auto-committed that means it can't permanently save all the changes in the database. They can be rollback.

INSERT: The INSERT statement is a SQL query. It is used to insert data into the row of a table.

Syntax:

```
INSERT INTO TABLE_NAME (col1, col2, col3,... col N) VALUES (value1, value2, value3, .... valueN);
```

Or

```
INSERT INTO TABLE_NAME VALUES (value1, value2, value3, .... valueN);
```

DML

Q10. Write a query to insert all the values to all the columns of the table “COURSE”.

```
 Autocommit Display 10 ▾  
INSERT INTO COURSE VALUES(24,30,'RITWIK',6000,'JAVA');  
INSERT INTO COURSE VALUES(25,40,'PRABHAKARAN',8000,'SQL');  
INSERT INTO COURSE VALUES(26,20,'AKASH',9000,'HTML');  
INSERT INTO COURSE VALUES(24,30,'RITWIK',6000,'JAVA');  
INSERT INTO COURSE VALUES(26,20,'AKASH',9000,'HTML');
```

Results Explain Describe Saved SQL History

1 row(s) inserted.

DML

Autocommit Display 10 ▾

```
SELECT * FROM COURSE;
```

Results Explain Describe Saved SQL History

COURSE_ID	COURSE_DURATION	COURSE_TRAINER	COURSE_FEES	COURSE_NAME
24	30	RITWIK	6000	JAVA
25	40	PRABHAKARAN	8000	SQL
26	20	AKASH	9000	HTML
24	30	RITWIK	6000	JAVA
26	20	AKASH	9000	HTML

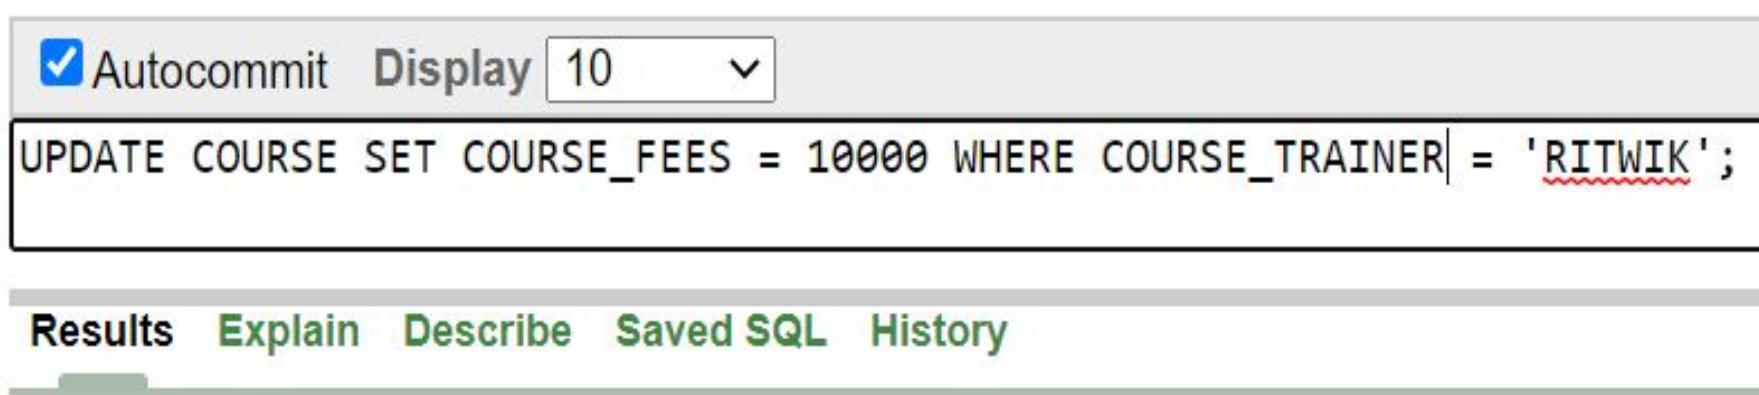

DML

UPDATE: This command is used to update or modify the value of a column in the table.

Syntax:

UPDATE table_name SET [column_name1= value1,...column_nameN = valueN] [WHERE CONDITION]

Q11. Write a query to update the value of course_fees from 6000 to 10000 where course_faculty is Ritwik in the table “COURSE”.

The screenshot shows a MySQL command-line interface. At the top, there is an 'Autocommit' checkbox (checked) and a 'Display' dropdown set to '10'. Below this, a query is entered in the command line:

```
UPDATE COURSE SET COURSE_FEES = 10000 WHERE COURSE_TRAINER = 'RITWIK';
```

Below the command line, there are several tabs: 'Results' (highlighted in green), 'Explain', 'Describe', 'Saved SQL', and 'History'.

2 row(s) updated.

DML

Autocommit Display

```
SELECT * FROM COURSE;
```

[Results](#) [Explain](#) [Describe](#) [Saved SQL](#) [History](#)

COURSE_ID	COURSE_DURATION	COURSE_TRAINER	COURSE_FEES	COURSE_NAME
24	30	RITWIK	10000	JAVA
25	40	PRABHAKARAN	8000	SQL
26	20	AKASH	9000	HTML
24	30	RITWIK	10000	JAVA
26	20	AKASH	9000	HTML

DML

DELETE: It is used to remove one or more row from a table.

Syntax:

```
DELETE FROM table_name [WHERE condition];
```

Q12. Write a query to delete all the rows from the table “COURSE” where the course is taken by “RITWIK” faculty.

The screenshot shows a MySQL command-line interface. At the top, there are settings for 'Autocommit' (checked) and 'Display' (set to 10). Below that is the SQL query: 'DELETE FROM COURSE WHERE COURSE_TRAINER = 'RITWIK';'. At the bottom, there are tabs for 'Results', 'Explain', 'Describe', 'Saved SQL', and 'History'. A progress bar indicates the query is still executing.

```
Autocommit: Yes  Display: 10
DELETE FROM COURSE WHERE COURSE_TRAINER = 'RITWIK';
```

Results Explain Describe Saved SQL History

2 row(s) deleted.

DML

Autocommit Display 10 ▾

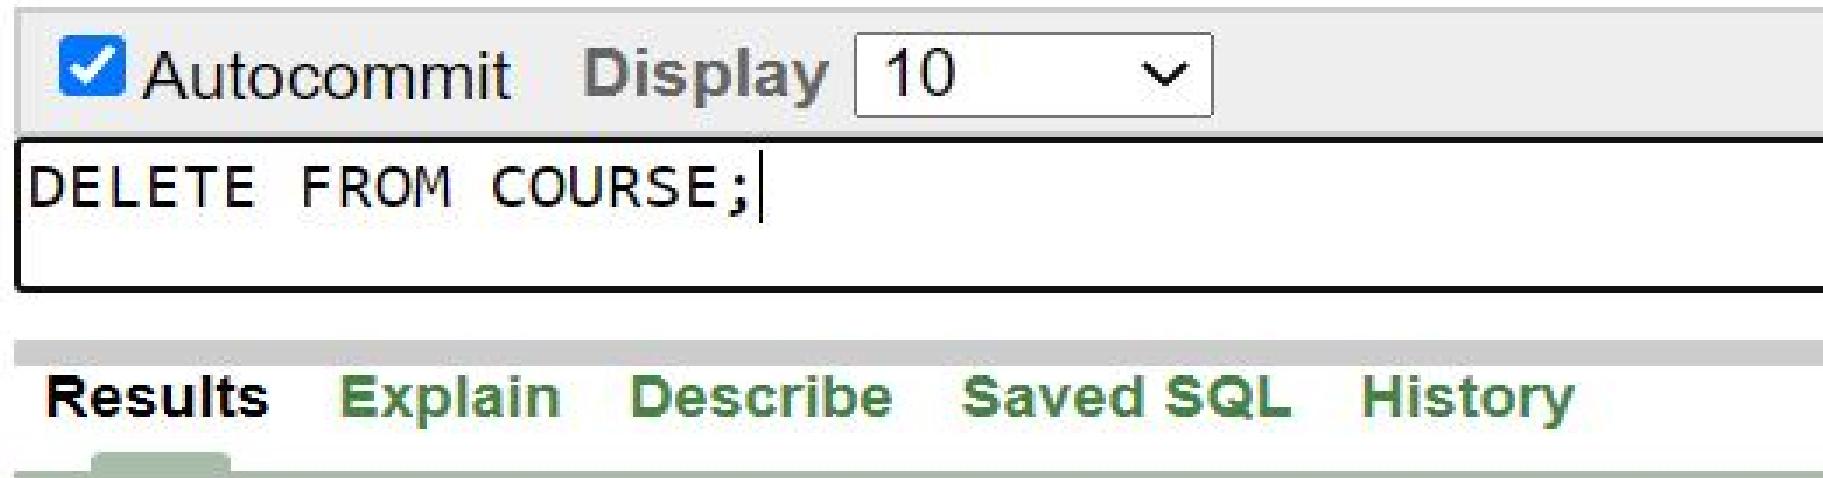

```
SELECT * FROM COURSE;
```

Results Explain Describe Saved SQL History

COURSE_ID	COURSE_DURATION	COURSE_TRAINER	COURSE_FEES	COURSE_NAME
25	40	PRABHAKARAN	8000	SQL
26	20	AKASH	9000	HTML
26	20	AKASH	9000	HTML

DML

Q13. What happens when no condition is specified in delete statement? Ex: DELETE FROM COURSE;

The screenshot shows a MySQL command-line interface. At the top, there is a toolbar with an Autocommit checkbox (checked), a Display dropdown set to 10, and a dropdown menu. Below the toolbar, the SQL query `DELETE FROM COURSE;` is entered in the command line. At the bottom, there is a navigation bar with tabs: Results, Explain, Describe, Saved SQL, and History. The 'Results' tab is active.

3 row(s) deleted.

DML

Autocommit Display 10 ▾

```
SELECT * FROM COURS
```

Autocommit Display 10 ▾

```

DCL

Data Definition – How to control Data.

- DCL commands are used to grant and take back authority from any database user. are used to enforce database security in a multiple database environment.
- Database Administrator's or owner's of the database object can provide/remove privileges on a database object.

DCL

Grant: It is used to give user access privileges to a database.

Syntax:

GRANT privilege_name ON object_name TO {user_name | PUBLIC | role_name}

Here,

privilege_name: is the access right or privilege granted to the user.

object_name: is the name of the database object like table.

user_name: is the name of the user to whom an access right is being granted. **Public** is used to grant rights to all the users.

DCL

 Run SQL Command Line

```
SQL*Plus: Release 10.2.0.1.0 - Production on Mon Jun 8 12:12:31 2020
```

```
Copyright (c) 1982, 2005, Oracle. All rights reserved.
```

```
SQL> conn
```

```
Enter user-name: system
```

```
Enter password:
```

```
Connected.
```

```
SQL> CREATE USER STUDENT IDENTIFIED BY STUDENT;
```

```
User created.
```

```
SQL>
```

New Password

New username

DCL

SQL> Run SQL Command Line

```
SQL*Plus: Release 10.2.0.1.0 - Production on Mon Jun 8 12:12:31 2020
```

```
Copyright (c) 1982, 2005, Oracle. All rights reserved.
```

```
SQL> conn  
Enter user-name: system  
Enter password:  
Connected.  
SQL> CREATE USER STUDENT IDENTIFIED BY STUDENT;
```

```
User created.
```

```
SQL> conn  
Enter user-name: STUDENT  
Enter password:  
ERROR:  
ORA-01045: user STUDENT lacks CREATE SESSION privilege; logon denied
```

Throwing error because system user has not provided any privilege to the new user student

Warning: You are no longer connected to ORACLE.
SQL>

DCL

 Run SQL Command Line

```
SQL*Plus: Release 10.2.0.1.0 - Production on Mon Jun 8 12:12:31 2020  
Copyright (c) 1982, 2005, Oracle. All rights reserved.
```

```
SQL> conn  
Enter user-name: system  
Enter password:  
Connected.  
SQL> CREATE USER STUDENT IDENTIFIED BY STUDENT;  
User created.
```

```
SQL> conn  
Enter user-name: STUDENT  
Enter password:  
ERROR:  
ORA-01045: user STUDENT lacks CREATE SESSION privilege; logon denied
```

Warning: You are no longer connected to ORACLE.

```
SQL> GRANT ALL PRIVILEGES TO STUDENT;
```

```
SP2-0640: Not connected
```

```
SQL>
```

We have to reconnect to user **system** to grant Privileges from it.

DCL

 Run SQL Command Line

```
Warning: You are no longer connected to ORACLE.  
SQL> GRANT ALL PRIVILEGES TO STUDENT;  
SP2-0640: Not connected
```

```
SQL> conn  
Enter user-name: system  
Enter password:  
Connected.  
SQL> GRANT ALL PRIVILEGES TO STUDENT;
```

```
Grant succeeded.
```

```
SQL>
```

Using system user to grant all privileges to new user student

DCL

SQL> Run SQL Command Line

```
Warning: You are no longer connected to ORACLE.  
SQL> GRANT ALL PRIVILEGES TO STUDENT;  
SP2-0640: Not connected  
SQL> conn  
Enter user-name: system  
Enter password:  
Connected.  
SQL> GRANT ALL PRIVILEGES TO STUDENT;  
  
Grant succeeded.
```

```
SQL> conn  
Enter user-name: student  
Enter password:  
Connected.  
SQL> CREATE TABLE STUD(  
  2  ID NUMBER,  
  3  NAME VARCHAR2(30)  
  4  );  
  
Table created.
```

```
SQL>
```

Now, Using create command to create a table named stud inside the new user student

ORACLE Database Express Edition

Home Logout Help

User: STUDENT

Home > Object Browser

The screenshot shows the Oracle Database Express Edition Object Browser interface. On the left, there is a sidebar with a dropdown menu set to 'Tables' and a search bar. A red box highlights the 'STUD' table entry in the sidebar. A blue arrow points from the text 'Checking through database home page' at the bottom to the 'STUD' entry in the sidebar. The main panel is titled 'STUD' and contains a toolbar with 'Create' and various navigation tabs: Table, Data, Indexes, Model, Constraints, Grants, Statistics, UI Defaults, Triggers, Dependencies, and SQL. Below the toolbar is a row of buttons: Add Column, Modify Column, Rename Column, Drop Column, Rename, Copy, Drop, Truncate, and Create Lookup. The main content area displays the table structure with the following columns:

Column Name	Data Type	Nullable	Default	Primary Key
ID	NUMBER	Yes	-	-
NAME	VARCHAR2(30)	Yes	-	-

1 - 2

Checking through database home page

DCL

Revoke: It is used to take back permissions from the user.

The syntax for the REVOKE command is:

REVOKE privilege_name ON object_name FROM {User_name | PUBLIC | Role_name}

DCL

SQL Run SQL Command Line

```
SQL*Plus: Release 10.2.0.1.0 - Production on Mon Jun 8 13:18:34 2020
```

```
Copyright (c) 1982, 2005, Oracle. All rights reserved.
```

```
SQL> conn  
Enter user-name: system  
Enter password:  
Connected.  
SQL> revoke all privileges from student;  
  
Revoke succeeded.
```

```
SQL> conn  
Enter user-name: student  
Enter password:  
ERROR:  
ORA-01045: user STUDENT lacks CREATE SESSION privilege; logon denied
```

```
Warning: You are no longer connected to ORACLE.  
SQL>
```

Taking back permissions from user student through user system.

When trying to access new user student, throws an error.

DCL

How To List Users in the Oracle Database :

- List all users that are visible to the current user:

SELECT * FROM all_users;

The ALL_USERS view lists of all users that is visible to the current user. However, this view doesn't describe the users.

SELECT * FROM all_users ORDER BY created;

- List all users in the Oracle Database:

SELECT * FROM dba_users;

The DBA_USERS view describes all user in the Oracle database.

SELECT * FROM DBA_USERS ORDER BY created DESC;

- Show the information of the current user:

SELECT * FROM user_users;

Autocommit Display 100 ▾

TCL

TCL commands can only use with DML commands like INSERT, DELETE and UPDATE only.

These operations are automatically committed in the database that's why they cannot be used while creating tables or dropping them.

- TCL used to control transactional processing in a database.
- A transaction is logical unit of work that comprises one or more SQL statements
